OceanaGold Haile Gold Mine Reverse Osmosis Foundations

MINING GOLD FOR A BETTER FUTURE

Focused on sustainability and operational efficiency, the OceanaGold Haile Gold Mine has invested in a state-of-the-art reverse osmosis (R.O.) plant to support its water purification needs. The R.O. system delivers high-quality, purified water for mining processes, reduces equipment wear, and aids in wastewater recycling, while contributing to lower operating costs and improved environmental compliance.

The Branham Group played a key role in the successful installation of the system, managing all aspects of foundation construction, rebar installation, and concrete placement, ensuring a sustainable solution that enhances both operational performance and environmental stewardship.
